Zero Trust Series: Device Assurance

CYBERSECURITY

HORIZON REPORT

In the first part of this Zero Trust series, Stratascale (an SHI company) discussed [identity management](#).

In this Horizon Report, we focus on device assurance. When integrating Zero Trust principles into your security program, you should start with identity management. But you can't rely on identity alone for Zero Trust. You must also tackle device assurance.

Most organizations focus on securing laptops and desktops, leaving other devices vulnerable. Security leaders should work with their organizations to build a device strategy that aligns with their Zero Trust program. An effective device strategy will enable the following:

- Support the needs of the business to gain value from new technology.
- Maintain the organization's desired security posture.
- Responsively adapt to the rapidly changing technology landscape.
